Applications in Traffic accident research to improve vehicle safety

Necessity of traffic accident research

Accident scenario in Germany

- Car occupants benefit from active and passive safety
- Numbers of accidents & casualties are stagnating since some years
- In 2016 persons:
  - Fatalities 3,206
  - Seriously injured 67,426
  - Slightly injured 329,240

→ In-depth accident studies are absolutely essential to improve vehicle safety
Applications in Traffic accident research to improve vehicle safety

Necessity of traffic accident research

Documentation of real traffic accidents

Accident data analysis

Area of studies
- Automotive engineering
- Transportation engineering
- Medicine

Applications in Traffic accident research to improve vehicle safety

Necessity of traffic accident research

GIDAS – German In-Depth Accident Study, since 1999

General information

Accident sketch

Technical investigation

Medical investigation

≈ 2.000 accidents/year
Applications in Traffic accident research to improve vehicle safety

Necessity of traffic accident research

Criteria

- Only accidents with personal damage

Investigation area

- Hanover
- Dresden

Source: Google Maps & GIDAS

Database

- Accident level: ~33,000 accidents
- Vehicle level: ~60,000 vehicles
- Personal level: ~77,000 persons
- Ø 3,500 single information/accident
Structure

1. Necessity of traffic accident research
2. Application assisted accident investigation
3. Data analyses for research on traffic safety
4. Pre-crash simulation to enhance traffic safety
5. Conclusion

Mathematical models – Injury Risk Functions (IRF)

What is it?
Model to describe the probability of the occurrence of a specific event (e.g. to be at least seriously injured) as a function of one or several influencing parameters (e.g. collision speed) for a given population.
→ Substantial tool for the assessment of vehicle safety systems

How is it calculated?
Based on real (accident) data, calculating the maximum likelihood estimation with an underlying logistic distribution

\[ p = \frac{1}{1 + e^{-z}} = \frac{1}{1 + e^{-(\beta_0 + \beta_1 x_1 + \ldots + \beta_n x_n)}} \]

\( \beta_0 \ldots \beta_n \) – regression coefficients
\( x_1 \ldots x_n \) – independent variables

Applications in Traffic accident research to improve vehicle safety
Data analyses for research on traffic safety
Applications in Traffic accident research to improve vehicle safety
Data analyses for research on traffic safety

Mathematical models – Injury Risk Functions (IRF)

What is it used for?

Real accident:
\( v_{\text{coll}} = 50 \text{ km/h} \)

Accident with system (e.g. AEB):
\( v_{\text{coll}} = 40 \text{ km/h} \)

\( p_{(\text{slightly injured})} = 26\% \)
\( p_{(\text{seriously injured})} = 62\% \)
\( p_{(\text{fatal})} = 12\% \)

\( p_{(\text{slightly injured})} = 17\% \)
\( p_{(\text{seriously injured})} = 60\% \)
\( p_{(\text{fatal})} = 23\% \)

\( v_{\text{coll}} \) = collision speed in km/h
Applications in Traffic accident research to improve vehicle safety
Data analyses for research on traffic safety

Mathematical models – Injury Risk Functions (IRF)

Multidimensional
Applications in Traffic accident research to improve vehicle safety
Data analyses for research on traffic safety

Calculation of deformation frequencies

- Normalized car dimensions and discretization into voxel
- Accumulation of accident deformations for 1000 passenger car

→ Analyzation of potentially safe places for sensitive and/or dangerous energy storage (e.g. battery or gas)

(2) - Steering to the left
(3) - Steering to the right
(4) - Max. deceleration + Steering to the left
(5) - Max. deceleration + Steering to the right
(6) - Max. acceleration + Steering to the left
(7) - Max. acceleration + Steering to the right
(8) - Max. acceleration
Applications in Traffic accident research to improve vehicle safety
Pre-crash simulation to enhance traffic safety

Point of no return $t_u$ when a collision is unavoidable

- Criticality as a function of time
  - continuous
  - differentiable
- No knowledge about the exact function
- $f(t_u) = 0$
  - no analytical solution possible
  - approximation by iterative process and variable integration step size

⇒ Efficient 2-step-approximation method
  1) Fixed step size of 1s
  2) Bisection method
Applications in Traffic accident research to improve vehicle safety
Pre-crash simulation to enhance traffic safety

Point of no return $t_u$ when a collision is unavoidable – Generic rear-end collision

$t_u = f(\Delta v, \mu); \ v_{obj} = 40 \text{ km/h}$
$\Delta v = 2 \ldots 100 \text{ km/h}, \ \mu = 0,1 \ldots 1,0$

AGENDA

1. Necessity of traffic accident research
2. Application assisted accident investigation
3. Data analyses for research on traffic safety
4. Pre-crash simulation to enhance traffic safety
5. Conclusion
Assurance of traffic safety must be a very high society target. Human errors must not lead to fatalities in a modern traffic environment!

In contrast to past trends, recent statistics show a stagnation in the accident numbers.

The development of Highly Automated Driving needs some more efforts to ensure a safe and modern concept of movement.

Therefore it is very important to improve on crucial aspects of
- ensuring functional safety
- study real world scenarios
- progress on perception infrastructure to support vehicle systems.
